Setup Angular project last version. Add git to the project and use it often, commits are important. Implement next functionality:

- Create a simple layout that needs to contain a name and logo.
- Apps need to have an authentication system on frontend. Users should be able to register and login with username and password. (In angular use NGXS or NGRX for saving data).
- Create a currency converter page. After successfully login, users need to be redirected to this page. On this page you need to have inout for amount an button to trigger action. For converting use this API https://rapidapi.com/warting/api/currency-converter/. Result of converting should be saved in the list.
- To create a currency page implement some popular HTML/CSS framework like Bootstrap, Bulma, Material.
- Page need to be responsive and to look nice on mobile device also.
